

Create a SQL query using GROUP BY to show the total number of orders placed by each user in an 'orders' table, displaying user_id and order_count.

The screenshot shows the MySQL Workbench interface. On the left, the 'SCHEMAS' navigator displays a tree view with 'emp' and 'instacore' (containing tables like influencers, pl, playlist, playlists, posts, restaurants, users, and views). The main editor window shows a SQL script with an INSERT statement into the 'orders' table. The script is as follows:

```
5 order_date DATE,  
6  
7 );  
8  
9 • INSERT INTO orders (order_id, user_id, order_date, total_amount) VALUES  
10 (1, 101, '2026-08-01', 499.00),  
11 (2, 101, '2026-08-05', 1200.00),  
12 (3, 102, '2026-08-10', 350.00),  
13 (4, 101, '2026-08-15', 799.00),  
14 (5, 103, '2026-08-18', 2100.00);  
15
```

Below the script, the 'Result Grid' shows the output of the query:

user_id	order_count
101	3
102	1
103	1

The bottom status bar indicates 'Result 1' and 'Read C'.
