

Comparison Between Procedural C and OOP TaskList

Procedural C Version

1. Data and functions are separate, so the code is harder to organize.
2. Managing multiple tasks is more difficult using separate variables or arrays.
3. Code is less reusable because operations are handled separately.

OOP TaskList Version

- Classes keep data and related methods together, making the code easier to organize.
- TaskList can easily store and manage multiple Task objects.
- Methods like `addTask()`, `markTaskDone()`, and `showTasks()` make the code reusable and easier to maintain.

Conclusion

The OOP version is better organized, easier to manage, and more reusable than the procedural C version.
