

Write a PL/SQL block that tries to divide two numbers entered as variables. If a division by zero occurs, catch the exception and print 'Cannot divide by zero'. Otherwise, print the result.

The screenshot shows the MySQL Workbench interface. The left sidebar displays the 'SCHEMAS' panel with a list of tables including foodorder, influencers, payments, orders, movies, pl, playlist, playlists, posts, restaurant, restaurants, spotifyuser, and users. The main editor window shows a PL/SQL block with the following code:

```
6 BEGIN
7   IF num2 = 0 THEN
8     SELECT 'Cannot divide by zero' AS Message;
9   ELSE
10    SELECT (num1 / num2) AS Result;
11  END IF;
12 END$$
13
14 DELIMITER ;
15
16 CALL DivideNumbers(10, 0);
```

The 'Result Grid' at the bottom shows the output of the execution:

Message
Cannot divide by zero
