

Create a table called Restaurant with columns: id, name, location, and cuisine. Apply NOT NULL constraint to name and location, and make id the PRIMARY KEY.

The screenshot shows the MySQL Workbench interface. The left sidebar displays a tree view of schemas, with 'instacore' expanded to show tables like 'influencers', 'pl', 'playlist', 'playlists', 'posts', 'restaurants', and 'users'. The main editor window is titled '1_question' and contains the following SQL code:

```
1 -- CREATE TABLE Restaurant (  
2 --   id INT PRIMARY KEY,  
3 --   name VARCHAR(255) NOT NULL,  
4 --   location VARCHAR(255) NOT NULL,  
5 --   cuisine VARCHAR(100)  
6 -- );  
7 select * from Restaurant;
```

Below the SQL editor, the 'Result Grid' is visible, showing a table with four columns: 'id', 'name', 'location', and 'cuisine'. All cells in the first row are marked as 'NULL'. The bottom status bar indicates 'Restaurant 1 x' and includes 'Apply', 'Revert', and 'Context' buttons.
